THE PROBLEM

"BUT IT WORKS ON MY LAPTOP!"

Dev Fusion

Copying files to the server by hand

✏

Editing code directly on a live server

Pushing at midnight and hoping nothing breaks

Writing code is one thing. Getting it into production is another. →

THE FIX

WHAT IS CI/CD?

CI · CONTINUOUS INTEGRATION

Every change you push is tested automatically.

CD · CONTINUOUS DEPLOYMENT

If the tests pass, it ships to the cloud automatically.

If any step fails, nothing ships. Your users stay safe.

QUICK QUIZ

SPOT THE LEAKED SECRET

A

```
const port = 3000;
const appName = "Codrithm";
const debug = false;
```

B

```
const db = "postgres";
const apiKey =
  "sk_live_51HxDEMOKEY";
const retries = 3;
```

C

```
const apiKey =
  process.env.API_KEY;
const region = "ap-south-
1";
```

TAKE THIS HOME

4 THINGS TO REMEMBER

Dev Fusion

1. Manual deploys break things.
2. A pipeline tests, builds and deploys for you.
3. Bad code gets stopped before users see it.
4. Secrets never go in code.

DEPLOYING IS EASY. SHIPPING SAFELY IS THE SKILL.
